Overview

The happening.now is a platform intended to prevent the spreading of fake news. To achieve this goal the core technology used is blockchain. In this System there are 3 main actors who interact with the system. The first actors are the newspapers, or media. The second actors includes editors and journalists who brings up new news. And the third actors are the approvers(includes freelance editors, reviewers,etc...).

Now the working is as following:-

The news organisations what their news published in their name and its done by the writers of that newspaper or the news publishing media. So the writers comes up with stories and the try to publish it to the distributed network. The writers also add information like the reference for their works,links to photographs,videos etc... and sends it to the approvers. The approvers checks the contents and the evidence submitted by the writer and also does their analysis and search (using tools like web crawlers) to collect information regarding the content to verify it and then share their view by approving or disapproving the contents.Thus a news with about majority claiming true is considered true.

Now the writers and approvers are rewarded with coins for their works. The newspaper organisations pays coins for their news to be published(through their editors). A part of the coin goes to the writer who came up with the story and the rest of the coins are distributed to the approvers based on their rating such that the approver with higher rating gets more share. The rating of the approver will go up for every decision he makes and which is also the majority decision. The rating goes down vice-versa.

Goals

1. To control fake news.
2. To prevent any partiality of the news.
